

ILLUSIVE SATELLITE IMAGERY

The following information is certainly in keeping with the findings of the Tait Family as being rather deceitful and insulting. We as lay people do find this rather strange considering the trail of exorbitant losses incurred by landowners.

1. **Online Satellite Imagery Providers**: There are various online platforms that provide access to satellite imagery. One commonly used platform is Google Earth. You can visit Google Earth's website and download the application for free. You can use the satellite view to see your property, but the overlay of a watershed might not be readily available on such platforms.
2. **Government or Public Sources**: Many governmental agencies and organizations in Canada provide access to geospatial data and maps, including watershed boundaries. These can be useful for landowners who want to understand the environmental context of their property. One such source is the Natural Resources Canada (NRCan) website. NRCan provides access to geospatial data through their GeoGratis portal, and you might find information about watersheds and boundaries there.
3. **Local Conservation Authorities**: In Canada, local conservation authorities often provide resources related to watersheds and land management. Contact your local conservation authority to inquire about available resources, which might include maps, overlays, and other relevant information.
4. **GIS Software**: If you have access to Geographic Information System (GIS) software, you might be able to create your own overlay of watershed boundaries on satellite images. You can obtain watershed boundary data from various sources, including government agencies, and then import this data into the GIS software to overlay it on the satellite imagery.
5. **Professional Services**: If you require more accurate or specific information, you might consider hiring a professional geospatial analyst or consultant. They can assist in obtaining and processing the required satellite imagery and overlay data to create a customized map for your property.
6. **Private Companies**: There are private companies that specialize in providing geospatial data and services. Some of these companies offer more advanced mapping and overlay options. You might need to pay for their services, but they can provide tailored solutions to meet your needs.
7. **Educational Institutions**: Some universities and research institutions offer access to geospatial data and tools for educational and research purposes. Depending on your situation, you might be able to access these resources. Keep in mind that the availability of specific data and resources might vary based on your location within Canada and the changes that have occurred since the last update. It's advisable to contact local government agencies, conservation authorities, or GIS professionals to get the most up-to-date and accurate information on accessing satellite images and watershed overlays for your property.

QUESTION :

Why is this so complex?

Is there something to hide?
